

Professional Headlamp Restoration System

Brighten unsafe, clouded headlight covers quickly and easily

Headlight covers take a beating from the road and from the environment. They become oxidized, yellow and hazy from sunlight exposure. Unlike car body damage from life on the road, defects to headlight covers can dramatically reduce light output and nighttime driving visibility, creating a major safety risk for drivers. Restoring headlight covers can also increase vehicle resale value while saving money by avoiding costly parts replacement.

DuPont's Professional Headlamp Restoration System clears the cloud layer, restoring the translucent clarity of a new headlight. Improvement in light output, or lumens, of as much as 300% has been achieved on severely degraded light covers.

You can achieve this kind of safety improvement for your customers' vehicles at little cost to you, and to them. The DuPont system requires only a minor investment to get started, and the repair techniques are easily learned by your in-house technicians.

The DuPont Professional Headlamp Restoration System includes our specialized compound and polish, and high quality buffing and polishing pads. Our unique solid formulas minimize material waste and cleanup compared to existing liquid products, while delivering better performance.

Everything you need to get started comes in the E-5183 Headlight Restoration Kit.

DuPont's Professional Headlamp Restoration System means safer nighttime driving for your customers, improved appearance and increased value for their vehicles, and a new stream of revenue for your business.
