700-10

Waterborne Degreaser

Glasurit® Brand Management is pleased to introduce 700-10, Waterborne Degreaser, a degreasing agent which is used to remove oil, silicone, tar wax and grease residues. 700-10 can be used on metallic and plastic substrates. The attributes of 700-10, developed with the use of an improved solvent system, make it a perfect complement to the 700-1 Cleaner. The 700-10 degreasing and cleansing agent complies with stringent VOC limits (1.5 pounds per gallon). Compared to conventional silicone removers, the VOC emission levels are reduced by 80 percent. 700-10 has good cleaning properties and an excellent anti-static effect (for plastics refinishing).

You can use 700-10 to clean surfaces to be refinished. 700-10 removes wax residues from all surfaces, as well as mold-release agents from plastic surfaces. When cleaning plastic surfaces, the cleaner produces an anti-static effect and thus reduces dust settling. 700-10 can be applied using a soaked cloth or a pump dispenser. When applied with a pump dispenser, the product ensures effective and efficient cleaning. Finish off by wiping dry with appropriate and clean tissues.

When applying 700-10, soak a lint-free cloth and wipe the surfaces to be refinished, or spray 700-10 or 700-1 onto the surface to be refinished and wipe them with a lint-free cloth. Use 700-1 to clean substrates *before* applying 76-71 1K Waterborne Primer or 90-Line metallic or solid color basecoat; as well as to clean substrates *after* fine sanding of surfaces primed with 76-61 1K Waterborne Primer. 700-1 is used as an anti-static agent *prior* to topcoat application (especially on plastic parts), and to clean spray guns *before* they are used to apply 76-71 or 90-Line metallic or solid color basecoat.
